

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently Amended) A process for the material recycling of LCDs, comprising
mixing the LCDs with a composition that comprises a mixture of noble and non-noble metals, wherein the proportion of LCDs in the resultant mixture as a whole is 5 to 50% by weight,
melting the mixture at a temperature range of 900 to 1700°C,
cooling the resultant melt,
breaking the cooled melt, and
separating a part of the cooled melt that is enriched in the noble metals from the remaining part of the cooled melt.

2-3. (Cancelled)

4. (Previously Presented) A process according to Claim 1, wherein the LCD-containing mixture is melted at a temperature range of 1200 to 1400°C.

5. (Previously Presented) A process according to Claim 1, wherein the LCDs comprise electronic components.

6. (Cancelled)

7. (Previously Presented) A process according to Claim 1, further comprising adding furnace sand to bind the non-noble metals in the melted mixture.

8. (Cancelled)

9. (Previously Presented) A process according to Claim 1, further comprising adding a carbon-containing product as a reducing agent to the melted mixture,

wherein the plastic films present in the LCDs act as the reducing agent.

10-20. (Cancelled)

21. (Previously Presented) A process according to Claim 1, wherein the composition that comprises a mixture of noble and non-noble metals is an ore.

22. (Previously Presented) A process according to Claim 1, wherein the composition that comprises a mixture of noble and non-noble metals is a catalyst, electrical or electronic scrap or metal-containing sludge.

23. (Currently Amended) A process according to Claim 1, wherein the proportion of LCDs in the resultant mixture as a whole is 5 to about 30% ~~50%~~ by weight.

24. (Currently Amended) A process for the material recycling of LCDs, ~~according to Claim 1~~, consisting essentially of
mixing the LCDs with a composition that comprises a mixture of noble and non-noble metals,
melting the mixture at a temperature range of 900 to 1700°C,
cooling the resultant melt,
breaking the cooled melt, and
separating a part of the cooled melt that is enriched in the noble metals from the remaining part of the cooled melt.

25. (Currently Amended) A process according to Claim 24 ~~Claim 1~~, consisting of
mixing the LCDs with a composition that comprises a mixture of noble and non-noble metals,
melting the mixture at a temperature range of 900 to 1700°C,
cooling the resultant melt,
breaking the cooled melt, and
separating a part of the cooled melt that is enriched in the noble metals from the remaining

part of the cooled melt.

26. (Previously Presented) A process according to Claim 25, wherein the proportion of LCDs in the mixture as a whole is 5 to 50% by weight.

27. (New) A process according to Claim 24, wherein the proportion of LCDs in the mixture as a whole is 5 to 50% by weight.

28. (New) A process according to Claim 24, wherein the composition that comprises a mixture of noble and non-noble metals is a catalyst, electrical or electronic scrap or metal-containing sludge.

29. (New) A process according to Claim 24, wherein the LCD-containing mixture is melted at a temperature range of 1200 to 1400°C.

30. (New) A process according to Claim 24, wherein the LCDs comprise electronic components.

31. (New) A process according to Claim 24, further comprising adding furnace sand to bind the non-noble metals in the melted mixture.

32. (New) A process according to Claim 24, further comprising adding a carbon-containing product as a reducing agent to the melted mixture, wherein the plastic films present in the LCDs act as the reducing agent.

33. (New) A process according to Claim 24, wherein the proportion of LCDs in the resultant mixture as a whole is 5 to about 30% by weight.
